Six-point Agenda for the Industry |
| 49   | APPENDIX |
| 53   | FOR FURTHER READING |
| 54   | NOTE TO THE READER |
THE PAST DECADE HAS seen a global transformation in how consumers watch videos and listen to music. From the days of terrestrial broadcast, social viewing of television to highly personalised, small screen consumption - the media industry is witnessing a transformation like no other. The rate of change in the industry only continues to accelerate, with hyper-competitive dynamics coming into play in India. There are the traditional players, and a strong push from global and more nimble companies to get into the OTT space. At the same time, India’s appetite for entertainment continues to increase as high speed broadband connectivity, ease of payment options and availability of multiple platforms creates the right environment for the consumers.

Powered by a first-of-its-kind consumer survey, this report seeks to address the changing Indian consumer, learnings from other global markets, niche areas such as internationalization, music and regional acting as the key strategic imperatives and the agenda which can drive success in a market with a potential for $5 billion.
Globally, OTT has become the key driver for video watching and media consumption growth, with an increasing number of people consuming over the top (OTT) content through varied platforms. In the last few years, OTT content, which is video content that is delivered over the internet as an alternative to traditional media, has seen substantial prevalence when compared to conventional forms of video consumption. Revenues from OTT content has seen a CAGR of 40 percent+ for the period 2005-2017 and is expected to see a growth of 20 percent in the period 2017-2023. In comparison, Public TV, FTA TV and Pay TV have seen a growth of 2 percent, 1 percent and 6 percent, respectively, in the period 2005-2017.

A Plethora of Services and Devices are Driving OTT Adoption, Globally
A key factor perpetuating this growth in consumption of OTT content is the fact that a considerable part of OTT content is delivered over smart and mobile devices (as shown in Exhibit 1). Key players are giving an additional fillip to this demand by investing in innovative technology and development of original content exclusively for OTT consumption. Furthermore, broadband connectivity has increased its footprints globally. Due to this, the other Internet-enabled devices including Smart TVs, STBs, and gaming consoles can also be used for the provision of OTT services. The advantage of using OTT service is that it is less costly in contrast to other traditional modes and more efficient and customized in terms of consumption. Moreover, it’s more customized and convenient compared to the traditional modes.

The Global OTT Opportunity
The global OTT opportunity is huge and has been pegged at ~USD 76 billion for 2018 (as shown in Exhibit 2). Such a large canvas allows both SVOD (Subscription Video-on-Demand) and AVOD (Ad-supported Video-on-demand) models to not only co-exist but also thrive. United States and Canada dominate the OTT market due to better connectivity which allows for wider circulation of OTT apps. Their continued dominance in the market can be credited to factors such as the availability of high-speed connectivity, the presence of established content creators and providers in the region and the significantly higher costs associated with more traditional modes of media consumption (like PayTV) which has made OTT into a more cost-effective solution.

APAC—Growing at a Fast Clip
The OTT market is growing at a fast clip in Asia-Pacific (APAC), Europe, the Middle East

and Africa (MEA), and Latin America. Therefore, OTT platforms in these regions have immense scope for enhancement. Asia Pacific is expected to be fastest growing market for OTT content during the forecast period 2017 to 2022 (as shown in Exhibit 2, 3). This is primarily attributable to the increasing number of viewers as consumers adapt and get used to OTT consumption and a steady but significant rise in local content creators and providers. This is also driven by the rest of the enablers (connectivity, payment ecosystem, device availability) coming together.

The Indian media industry seems to be an outlier relative to more developed markets in terms of ad growth and penetration. This gap creates an opportunity for India to grow from current levels. As per our estimates, India reaching China / Brazil levels would imply 6 percent CAGR + GDP growth (5-7 percent) i.e. 10-13 percent CAGR for the next 10 years for the overall media industry.

As more and more people spend a larger portion of their time in the digital realm, it is inevitable that advertising goes digital as well. While traditional media continues to be the media of choice for consumers with an overall share of 84 percent, India is seeing an increase in the share of digital in media consumption (as shown in Exhibit 4). This will most likely influence the impact and growth of digital advertising as well.

The Indian OTT Phenomenon, Already Large, So Far Additive Not Cannabilizing

Overall, it is estimated that 16 percent of media consumption in India is already on digital media. Relative to developed countries, India is lagging. However, for the Indian youth, already 25 percent of media consumption is digital (as shown in Exhibit 4). This indicates that the growth in India is likely to catch up.

There is a distinct difference in the shape of digital consumption in India. The digital consumption (relative to traditional TV and print) in India has been additive and not cannabilizing traditional media consumption. For e.g. in the past one year (between 2016 and 2017), overall media consumption grew for all seg-

ments of consumers. Those who also consume digital media—total consumption grew more sharply, however consumption of traditional media did not decline substantially (as shown in Exhibit 5). This indicates the robustness of the underlying consumer trend in India—there is headroom for growth for media overall, with digital media growing more sharply. This is in stark contrast to developed markets where OTT has taken share from traditional media.

The Indian OTT Space is Already Hyper Competitive With All the Ecosystem Players Vying for Consumer Attention

Indian OTT space is hyper competitive and has attracted varying types of players which offer varied value propositions to the consumers and have different business models.

There are multiple business models evolving in India (as shown in Exhibit 6).

- All large successful broadcasters in India have launched their own OTT platforms e.g. Hotstar, Voot, Sony Liv and Zee 5. These broadcasters have put their extensive TV content libraries online, supplemented by additional content through licensing and originals. In India, these players enjoy a strong brand and consumer awareness driven by their strong TV brands. These OTTs have a combination of ad supported and behind the paywall content. This is unique to India—as broadcasters were quick-off-the-block in the OTT space and are hence, well entrenched in the OTT space.

- Global OTT platforms e.g. Netflix, YouTube, Amazon Prime have extended their services into India. Historically, India developed a video watching habit with YouTube. The global OTTs (e.g. Netflix, Amazon Prime) have started investing in local Indian content in a significant way.

- In addition, the telcos e.g. Airtel, Jio and Vodafone-Idea are building aggregator models- aggregating content across multiple platforms and providing a payment interface. They are also leverag-
ing access to other OTTs as a differentiating factor to drive consumer retention and acquisition.

- We are also seeing independent OTTs evolving, being supported by content creators.

- Social media platforms continue to be an important source of video consumption, and social media players are leveraging this by increasing their focus on video content.

- Traditional TV distributors (cable, DTH) are also experimenting with different models to participate in the digital media space.

Most of these players and models have evolved and entered the market in the past 5 years. The year 2017 saw the first burst of “big money” being deployed behind Indian content on OTT. Heavy investments are now underway across multiple players. The numbers of players in the Indian OTT market have witnessed a 3.5x increase in the last six years growing from just nine players in 2012 to 32 in 2018 (as shown in Exhibit 7).

Investment for original content by OTT players is increasing at a fast clip. In addition to live sports rights, the nature of shows produced is also evolving—tent pole properties built for OTT are at a cost per hour of 3-4X cost of traditional TV content (as shown in Exhibit 8). The need to differentiate to attract eyeballs is enabling aggressive bets on original content.

We have analysed the types of investments being made on OTT content across platforms. These investments are in very varied forms of content with different propositions (as shown in Exhibit 9) e.g.

- “Tent poles” or “hero content”: heavily marketed, premium content (higher cost of production)—meant to bring new eyeballs on the platforms

- Hit movies—expensive to buy, but attract eyeballs

- High profile sporting events

- Syndication of international content
EXHIBIT 7 | Heavy Investments in Content by Multiple Players Also Already Underway, No Longer "Just Lip Service" as Market Clearly Important

NO. OF PLAYERS IN THE OTT MARKET HAVE INCREASED 3.5X TIMES IN THE LAST 6 YEARS

1Factor of winning bid for digital rights assumed to be same factor as winning global bid.

EXHIBIT 8 | Cost of Content Significantly Increasing as OTT Platforms Bet Aggressively on Originals

"UPGRADE TO TV"
- TC Stars in a newer digital format
- Storylines and ideas that would not work on traditional TV
- Appeals to mass audiences
- Example: Karrle Tu Bhi Mohabbat Season 2 launched within 9 months of Season 1
- Costs per hour at 2x to 3x cost of TV content

"RETELL CLASSICS"
- Adapt Classical stories for newer audiences
- Build and develop on the immense fresh talent pool
- Appeals to Large segments of the audience
- Dev DD – a modern take on Devdas has over 1m viewers already and soon entering Season 2
- Costs per hour at 2x to 2.5x cost TV content

"TENT POLE"
- Original and exclusive high impact content
- Utilize the best talent available including Film talent
- Appeals to niche but still large segments
- Bose Dead/Alive has an IMDB rating of 9.4 – one of the highest for a web series
- Costs per hour at 3x to 4x cost of TV content

Source: Balaji Investor Presentation, BCG analysis.
EXHIBIT 9 | Different Types of Content developed and syndicated by OTT platforms

OTT PLAYERS ARE ALREADY BETTING BIG ON VARIOUS TYPES OF CONTENT

- **Content around content**: Bigg Boss
  - Web-series: Ghoul, Comicstaan, On Air AIB
- **Live Sports**: IPL, Premier league, FIFA World Cup Russia 2018
- **Play along**: Jio Cricket, Bigg Boss, KBC
- **Tent Poles**: Inside Edge, Sacred Games, Orange is the new Black, Stranger Things
- **Regional Originals**: Gangstars, As I’m suffering from Kadhal
- **Movies**: Dunkirk, Raazi, Masaan, Udta Punjab
- **OTT App 1**
  - Netflix, Amazon Prime video
- **OTT App 2**
  - Hotstar, Voot
- **OTT App 3**
  - Voot, Hotstar, Zee5
- **OTT App 4**
  - JioTV, Sony LIV, Hotstar
- **OTT App 5**
  - Amazon Prime video, Hotstar
- **OTT App 6**
  - International content syndication
- **OTT App 7**
  - The Big Bang Theory, Game of Thrones

1Based on numerical average across select group of 9 apps.
• Original content / web series (Hindi, English and regional) : build up library of differentiated content

• CAC (Content around content) specifically around reality TV, sports and others also covered on traditional TV

Intense Competition: Race to be Among the top 3 Video Apps for Consumers

Most consumers (81 percent) have up to 3 video / OTT apps on their smartphone (as shown in Exhibit 10 on previous page). Further, all platforms struggle with retention of consumers—on an average 50 percent of OTT apps installed are uninstalled in the first 7 days of installation. The competition for user share is intense—every OTT platform is vying to be among the top 3 of the consumer’s attention.

Lessons from the Dragon Nation

CASE-STUDY: CHINA—CONTENT DRIVEN SVOD GROWTH

It would be instructive to observe the evolution of the OTT landscape in China. In both India and China, OTT is unlikely to be driven by consumer price advantage. In the United States, the average revenue per user (ARPU) per month is USD 89 and USD 11 for Pay TV and SVOD, respectively. In contrast, in China and India the ARPU for Pay TV is USD 3 while the ARPU for SVOD is USD 3 and USD 2, respectively. The gap in what the consumers are willing to pay for online content is significant when you compare India and China with other more evolved markets like the United States, Canada and Australia.

Interestingly, the country has witnessed an exponential growth of 200 percent+ (2014-2017) in SVOD subscribers. Over a mere 5-year period, >35 percent of China OTT revenues are from subscription services.

THE CHINESE STRATEGY—GIVING LEGS TO SVOD GROWTH

Top players leverage AVOD users base to create hits and drive SVOD conversion—good quality original content lies at the heart of the OTT industry. A heavy push was made by AVOD / SVOD platforms to build new categories of “web series” that would allow for the manufacturing of hits and higher user engagement. These “hit” shows were used as a vehicle to drive conversion of free viewers into paid subscribers. Efforts were also made to have a deeper engagement with “free users” in an attempt to create more watch-time and therefore ad-sales opportunities.

The Chinese SVOD model enabled by a “paying members watch first” model that was successful to get Chinese consumers to pay for content—consumers are generally more inclined to pay for exclusive content. The Chinese developed a “paying members watch first” model that created exclusivity and enticed non-paying members to start paying for exclusive content. The four-step process of this model is as follows:

1. Free access to all users to the weekly release of a single new episode

2. Free users are teased with trailers of episodes to be released in future weeks

3. On the other hand, paying members are given instant access future episodes which could sometime comprise an entire season

4. After the shows competes all the weekly releases, all the episodes except for the first one become exclusive to paying members

Led with few big bets, built watch-time with cheaper content library—in order to stay ahead in the OTT game, players need to constantly invest in creating original content (as shown in Exhibit 11). However, in order to be profitable, these investments need to be done judiciously keeping in mind the preferences of the target audience and their inclination to pay for exclusive content. The Chinese model did this right by making a few large investments in non-exclusive content and building watch-time with a cheaper content library.

Heavy original content investments triggered the huge SVOD uptake—the main factor that perpetuated a huge uptake in SVOD was heavy investment in creating original content. The ubiquity of technology and consequently access to a large amount of con-
tent makes it difficult for content providers to attract and retain a consumer’s attention. The number of original series for the top three players in China has been consistently increasing and has risen from just 13 in 2012 to 143 in 2016 (as shown in Exhibit 12).

Building social media platform for driving fandom and fan engagement—connecting fans with celebrities and bringing them closer to the content / content creators across formats. By strengthening the connection among fans, celebrities and content, the platform enhances user engagement and stickiness.

Paopao, for instance, is the social platform built and used by iQiyi. iQIYI Paopao features a wide range of social functions. Within each topic of interest, fans can generate content by posting texts, images and videos, as well as interact with others through features such as commenting, giving likes and private messaging. By virtue of its social media nature, iQIYI Paopao serves as the base for online and off-line fans activities. Moreover, they frequently organize celebrities to interact with fans on iQIYI Paopao in real-time, to attract and retain users. iQIYI Paopao also serves as a key publicity platform for video content, including inviting popular actors of original drama series to interact with the fans in the “Celebrity is Here” section of iQIYI Paopao to boost the content’s popularity.

In addition, with enabling mobile payments and telecom infra, subscription has overtaken advertisement revenues for the top players—for any industry to thrive, a supportive eco-system needs to be built around it. A robust digital and telecom infrastructure was instrumental in giving a fillip to the OTT industry in China. It has been noted that a 26x increase in mobile payment value coupled with a 4.6x increase in broadband speed between 2013 and 2014 has enabled strong revenue growth in the industry, especially for subscription based revenues (as shown in Exhibit 13).

India is Potentially at an Inflexion Point for OTT Growth
Several drivers for growth of OTT in India are falling in place:

- Improving connectivity and fall in data prices
- Increased smartphone penetration
- Favourable demographics (age, affluence)
- Supply of content building up

It is estimated that by 2020, India will have more internet users than the population of the G7 countries combined (as shown in Exhibit 14).

Improving Connectivity and Fall in Data Cost
Access to affordable data has perpetuated a sharp growth in the consumption of data. The launch of Jio heralded a new era of affordable data in the country. It has been observed that post the launch of Jio in September 2016, the quarterly consumption of data has increased nearly ten-fold (as shown in Exhibit 15). This unprecedented growth has largely been driven by media consumption on mobile. While on-the-go consumption of content is simple and efficient, the launch of Jio has also made it affordable, providing an avenue for the latent demand for digital consumption of Indian consumer.

Increase in Smart Phone Penetration
Over the last five years, India has witnessed a tremendous growth in TV and smartphone penetration. This growth has been more of a global phenomenon as smart phone have become an integral part of every individual’s life. Today, across the globe, there are 3 billion smartphones in which the Indian market accounts for 450+ million smartphones (as shown in Exhibit 16). When it comes to TV, in the last 2-3 years the evolution of smart TV has taken place, which means that we are no longer at the mercy of the set up box or cable for content. Consumers now have the choice to watch content on the web or on a mobile app or on their smart TVs.

EXHIBIT 14 | India Already has more Internet Users than USA and By 2020, # of Internet Users in India Will be More than G7 Population

EXHIBIT 15 | India Saw Content Consumption Exploding With Data Usage Exponentially Increasing as Jio Launched and Prices Dropped

Unprecedented growth driven by media consumption on mobile

Sources: Tefficient Industry analysis 2016, TRAI, BCG analysis.

EXHIBIT 16 | Tremendous Growth in TV and Smartphone Penetration has Been Witnessed in the Last Five Years With More Scope for Growth From Rural India

Sources: Internet and Mobile Association of India, Ovum, BARC, BCG analysis.

1TV penetration measured as % of households which have a TV.
2Smartphone penetration is % of mobile phone users.
Supply of Content
When most OTT platforms first made their entry into the market, they started off with catch-up shows. However, the entry of global players like Netflix and Amazon Prime Video that brought with them a plethora of rich, original content, has now compelled existing Indian players to move beyond just catch-up, syndicated and licensed content. The entry of Netflix also indicated that the Indian consumer is now ready to pay for compelling content.

Availability of a wide variety of content has attracted a large number of people across the country with differing sensibilities and choices. With a growth in viewership, share of online video advertising is also set to increase.

Favourable Demographics
India is witnessing significant shifts in income distribution patterns with a rise in “affluent and elite” (as shown in Exhibit 17). With increasing urbanisation, we are seeing a shift in demographics as more and more people become upwardly mobile. This coupled with increasing connectivity and easy availability of smartphones has led to a spurt in consumption of online content.

In addition, there is a democratization of internet access taking place which will expand the consumer sets (move away from just metro, male, millennial) and expand into rural India (as shown in Exhibit 18).

The rural story in India is likely to be even more interesting. There are an estimated 197 million households with a TV, of which 160 million are C&S households—while smartphone penetration is multiples of that and growing. Given the challenges of electricity availability, TV screen, C&S connections, it is possible that rural India adopts OTT even ahead of C&S viewing in some pockets. Our estimate is that nearly 50 percent of internet users in India, by 2020, will be from rural India and rural internet penetration could grow to as much as 35 percent (as shown in Exhibit 19). This creates a very healthy environment for OTT to take off in rural India. There is a strong possibility, given prices and penetration, that rural India may be an OTT first market.

**FUTURE GROWTH IN RURAL INTERNET USERS SHOULD BE SIMILAR TO WHAT CHINA WITNESSSED A FEW YEARS AGO**

---

Just the Tip of the Iceberg

We believe that the Indian OTT market is poised for growth and both ad supported and consumer pay model will continue to co-exist. The consumer pay model could take many different shapes ranging from pure OTT SVOD to Telco drive aggregator model as well as TVOD particulary in categories such as films and sports. It is expected to reach a market potential of $4.5 to 5 bn by 2023 (as shown in Exhibit 20). However, tapping this potential will require a host of player actions to fall in place; these include availability of relevant differentiated content, development of regional markets and many others. These are described in the next section of this report. As content evolves and becomes differentiated, we believe that consumer pay models will evolve further in India—with SVOD becoming a substantial part of the market.

As the market evolves, the phenomenon of second screen, privacy etc will surface more strongly. Consumer will likely to continue to have few apps on their phone that are actively used. Consumer pay models will evolve driven by supplier actions and consumer behavior. However we believe that in India AVOD, SVOD, TVOD etc. will all co-exist and serve different consumer needs, While consumer pay models will grow faster than ad supported ones.

Underlying drivers for SVOD growth: strong content development & ability to pay
We expect ~40-50 mn paying subs in India by 2023, while ~600 mn users will be users of AVOD

As in developed markets, the phenomenon of multiple apps per person also playing out
On an average Indians use 2.3 OTT video apps; 68% users have 2 or more than 2 OTT video apps

1Nielsen Panel of ~15000 smartphones recorded from Q2 ’16 to Q2 ’18.
OVER THE LAST FEW years, consumer behaviour in India has witnessed several major upheavals.

From a cost-sensitive, middle-income demographic, the country is now more affluent, with a concurrent preference for convenience, as a key driver as ~60 percent of urban consumers prioritize saving time over money. By 2025, India’s two leading income segments will double and account for 40 percent of all consumption. With increasing reach and influence of internet in India, the general profile of internet users of India is also widening. Research suggests that by 2020, internet penetration among users in non-metro cities will reach 77 percent, and among females will reach 40 percent. This is propelled primarily by the mass adoption of smartphone technology. This isn’t simply because smartphones are perceived as a modern necessity—55 percent buyers report purchasing a smartphone for an ‘upgrade’ factor, without any real need or ‘push’ (as shown in Exhibit 21).

Online Video Viewing has been the Highest Growth Category
In less than a year, time spent on video has jumped 11 percent, even as smartphone users spend incrementally less time on social media, browsing, gaming and calling (as shown in Exhibit 22).

This transition of today’s consumer towards increased watching of video opens a major opportunity for OTT players who can provide highly immersive and engaging viewing experiences. In order to decode the size and shape of the OTT opportunity, a detailed consumer research (n=5000) and analysis of Nielsen’s smartphone panel (n=15000) was undertaken. The objective of the research was to gain insights around consumer behaviour on the triggers and objectives for OTT usage, patterns of actual usage and how those are evolving, to retention and churn behaviour. The in-depth qualitative research also threw up insights on the content and genre preferences of consumers.

Insights from Consumer Research
The consumer research threw up many interesting insights. Many data points confirmed our going-in hypotheses while others challenged them.

The following are the top 6 consumer insights from the research and their implications.

1. Three archetypes of consumers based on their current usage patterns—TV heavy (“traditionalists”) ~60 percent of our sample; AVOD heavy (OTT experimenters) ~30 percent of our sample; SVOD heavy (the early adopters) ~10 percent of our sample (as shown in Exhibit 23)
RISING AFFLUENCE WILL DRIVE UP CONSUMPTION

- India’s top 2 income classes (>2M) combined share to increase from 8% to 16% in 2025,
- Accounting for 40% of the total consumption

DIGITAL INFLUENCE AND SPENDING NO LONGER STEREOTYPED

- Profile of Internet users in India is changing, with 2020 penetration expected to rise among non-metros (77%), females (40%) etc.

SHOPPING IS A ‘LIFESTYLE REFLECTION’

- ~55% of urban consumers bought a new smartphone or TV as they simply wanted an upgrade, with no real need to change

CONVENIENCE AT ANY AND ALL COSTS

- ~60% of urban consumers prioritize saving time over money

CONSUMERS SEEK VALUE, NOT NECESSARILY DISCOUNTS

- ~60% of recent smartphone buyers believe their purchase was value, though they did not avail any deals

Sources: BCG CCI Digital Influence Study 2013, 2014, 2015, 2016 analysis (N=18,000 per year), BCG CCI Consumer Trends Study 2018 (N=5000); BCG CCI analysis.
Experimenters using AVOD heavily—to watch on the go, create a “second screen” in the household, and fulfilling specific watch occasion of “snacking in break times at work” / “while commuting”

SVOD installation driven by desire for popular / exclusive content as well as ease of use

Consumers seek “value for money”—with so much free content available demand justification for premium charged by paid platforms. Hence, there is an overall discomfort (among both experimenters and early adopters) against subscription charges. There is a need to establish a distinct value proposition for consumers so that they try services and then continue to pay

Lapsing on AVOD driven by undifferentiated value proposition, high / hidden data usage, overall drain on mobile battery and preference to watch some types of content on the large screen still after experimenting with mobile usage

2. Despite the abundance of existing content, consumers seek even greater variety for content, tailor made to their specific needs; specifically, regional language content is a key need voiced by consumers

3. App combinations have a really long tail—hence the quest for being in the top 2-3 apps will be really critical for players to gain scale in this market

4. “Hero” content is able to get consumers on the platform—but cannot retain all of them

5. Awareness of available propositions continues to be a challenge—need to find ways to break the clutter

6. Music has traditionally not been a large opportunity, however, it does attract eyeballs

Three Archetypes of Consumers Based on Their Usage Behaviour

- **TV Heavy Users**—The Traditionalists (~60 percent of those surveyed)
- **AVOD Heavy Users**—The OTT Experimenters (~30 percent of those surveyed)
- **SVOD Heavy Users**—The Early Adopters (~10 percent of those surveyed)

In today’s market, SVOD is a more “metro” and higher affluence phenomenon while the traditionalist TV watchers are 50 percent at living in tier 1 & 2 (as shown in Exhibit 23).

The profiles below describe who is a typical traditionalist / OTT experimenter / early adopters (as shown in Exhibit 24 to 26).

The three archetypes display distinct preferences. Traditionalists prefer watching their preferred genres on a bigger screen, which is a key trigger for their use of TV. On-the-go watching is the key driver for OTT use, as it allows access to consumers’ favorite content on demand. There is a demonstrated willingness to pay to access favorite content in high quality, and subscribers tend to stop using SVOD apps if they feel that the content does not justify the subscription charges.

Exhibit 27 shows the genre preferences of each of the archetypes—as being quite distinct. SVOD usage only spikes for the third segment of “early adopters”, both the traditionalists and experimenters are not yet switching any significant viewing to subscription platforms.

**Freely accessing favorite content on demand—Key driver behind choice of OTT Experimenters (AVOD primary viewers)**

The OTT experimenters use the freely available content of AVOD to explore the offerings of the OTT space. The consumer research indicates that watching on-the-go emerges as a key reason for AVOD use.

On-the-go accessibility of content has allowed these users to watch content when a television might not be available. OTT experimenters indicate that they heavily use

| WATCHING ACROSS A DAY |

1. **Context:** Breaks during work
   - **Content:** Inspirational videos, online clips
   - **Platform:** YouTube
   - **Screen time:** 30 mins

2. **Context:** Family time after work
   - **Content:** News, NGC, Discovery, etc.
   - **Platform:** TV
   - **Screen time:** 1.5-2 hours

**Key Reasons for lower OTT usage**

Preferred genres already on TV and mobile screen unsuitable for family watching together

---

Source: In-Person Interview.
Exhibit 25 | Sample Profile—OTT Experimenter

Diksha, 22
Occupation: Student
Daily screen time: 2-3 hours
OTT apps (highest usage): YouTube, Zee5, Hotstar, Voot
City: Surat

“I like to watch the repeated shows sometimes I even miss some old episodes. That’s why I like to watch online.”

Preferred genres: Movies and serials
- Movies, serials, trailers, workout videos, etc. on mobile
- News on TV and YouTube
- IPL on Hotstar

Pain-points
- Lack of variety in content in broadcaster OTT apps
- Time-crunch doesn’t allow watching long durations

Influences for watching
- Content driven: Used mobile apps for specific content like Raazi and splitsvilla
- Older episodes of shows on demand
- Shorter duration content

Key Reasons for AVOD Use:
Access to favorite content on demand and option of watching in shorter sessions

Exhibit 26 | Sample Profile—Early Adopter

Karthik, 38
Occupation: Professional
Daily screen time: 3-3.5 hours
OTT apps: Netflix, Amazon Prime, AirtelTV
City: Bangalore

“I can’t even think of when was the last time I did a download, because I watch everything that I want to. I pay for the content, because of the easy availability of it.”

Preferred genres: Web series, movies
- Web series on Amazon Prime and Netflix
- Movies on Airtel TV
- Content in Tamil language

Pain-points
- Buffering and freezing of content on the app
- Lag in videos on the app

Influences for watching
- Sci-fi and fantasy, horror, and crime
- Content in Tamil language
- Content in High Definition

Key Reasons for SVOD Use:
Access to favorite content in high definition
AVOD in watching while traveling, creating a second-screen at home to watch when the TV is occupied and fulfilling specific watch occasions such as watching in short breaks during work (as shown in Exhibit 28). The discontinuation of AVOD is primarily driven by three reasons: the undifferentiated value proposition of AVOD content, the inclination against ‘small-screen’ devices as a viewing platform (after experimenting with these platforms) and the high consumption of data and mobile-battery life by AVOD apps (as shown in Exhibit 29).

Consumers have a high awareness of AVOD apps, the awareness of at least one more app in addition to primary OTT (primary app being Youtube in most cases) is at 88%. There is also a healthy 48 percent trial / uptake with consumers choosing to use AVOD apps (as shown in Exhibit 30). Due to the vast content offering on the many available AVOD apps, consumers are quick to move past the apps they don’t like, as evidenced by the fact that over 25 percent of AVOD users delete their apps in order to replace them with other apps (as shown in Exhibit 30).

**Value-for-money—Key driver behind choice for subscription platforms**

With so much content available freely, consumers who subscribe for video content seek value for the money they invest in SVOD. Consumers want to conveniently access their favorite content, hence, when it comes to choosing SVOD apps, desire for popular and exclusive content and ease of use of the app drives installations (as shown in Exhibit 31). While there is an overall discomfort against subscription charges, in both the experimenters and early adopters, ‘not value-for-money’ is the primary reason for the discontinuation of SVOD apps. Research indicates that the top reasons for deleting SVOD apps are high sub-

- Same content on TV/Apps
- Stopped once specific show over
- Free version over

Range of responses: 36% to 48%

Source: Consumer Research, BCG analysis
Q: What are your key reasons to install the app?
N = 1322 SVOD heavy users
Subscription charges, better content being found elsewhere and free access to content elsewhere. Consumers demand justification for the premium charged by current OTT platforms, and hence, there is a need to establish a distinct value proposition for consumers to want to continue paying subscription charges for content (as shown in Exhibit 31).

The key drivers for subscribing to SVOD platforms are around access to favorite content, popularity and curiosity—these are quite different from the reasons for which viewers install AVOD apps. The issue among consumers seems to be one of “value for money”. Similarly it indicates why many consumers do not subscribe to SVOD in the first place (as shown in Exhibit 33).

SVOD apps have a healthy consumer funnel, with over 50 percent awareness (even when awareness is more tightly defined as recall of at least two SVOD apps) and over 25 percent using an SVOD app in the last six months. 4 percent of the overall sample discontinued the use of their SVOD apps which is ~15 percent as ratio of those who have tried an SVOD app (as shown in Exhibit 32). The funnel indicates several implications for SVOD players:

- Improve awareness—create broader recognition among consumers
- There is a 50 percent drop-off between recall and trial / purchase
- Improving retention / reducing churn important for sustainable growth of user base

In summary, consumer journeys are complex and evolving. They involve multiple decision points both as triggers for use and discontinuation of use. It is clear that platforms need to evolve and communicate a distinct offering to attract and more importantly continue to retain consumers. The digital viewing behaviors are similar across consumer demographics. However, it is clear that consumers are willing, able and increasingly experimenting with online video viewing in the course of their normal day. India, therefore, is on the cusp on an online view boom which is likely to become the new normal—if players can create distinct propositions.

**EXHIBIT 32 | Healthy Consumer Funnel for SVOD**

| Source: Consumer Research, BCG analysis. N = 5000 |

1 SVOD apps considered for the analysis are Amazon Prime, Hoichoi, Hotstar Premium, Netflix, and Zee5 Premium
Regional Content as a Key Need Voiced By Consumers

With the diversity in India, which has 22 official languages, content in regional languages has always been important. Historically, this preference can be seen in the circulation of newspapers. In the top 15 dailies (by circulation), 7 are regional newspapers. In the last decade, newspapers in Hindi and vernacular language has grown at 8 percent, faster than English dailies, which only grew at 2 percent, as literacy numbers have climbed up across India. This preference is also seen today, as content in regional languages is a part of the lives of consumers today (as shown in Exhibits 34 and 35)

**Strong preference for regional language content among consumers**

In a survey of ~5000 consumers in India, over 40 percent of consumers said that they prefer content in regional languages, indicating the strong preference for regional language in the country (as shown in Exhibit 36). Consumption of content in regional languages has already seen a tremendous increase, with increasing demand and content offerings in regional languages. OTT players in India are already recognizing this opportunity by adding specific regional content libraries to their product offerings.

**OTT platforms have already started on the path to regional content**

Many OTT players are gearing up to tap into the regional opportunity. OTT players exclusive to regional languages and originals such as Bangla content centric Hoichoi and Sun NXT, which has a library in Tamil, Telugu and Kannada, have already begun to emerge. There are many OTT players that are currently releasing originals in local languages. Hotstar ran an original show in Tamil, ‘I’m Suffering from Kadhal’, AltBalaji has original shows in Bangla and Tamil, while SonyLIV created shows in Gujarati (Kacho Papad Pako Papad) and Marathi (Yolo).

While some OTT players are already operating in the local space, many global and broadcaster OTT players also have plans in place to invest in local content. Zee5 plans to release 90+ originals across 12 languages by 2019, and Netflix plans to release at least 10 original shows and movies annually in India. Am-

SUPER USER WITH KANNADA LANGUAGE PREFERENCE

NEEDS
- Reality shows, Kannada, Tamil, and Telugu movies and music
- Needs only Kannada serials as Pitta Gowrie Mauve and Radha Ramana
- Religious serials like Shani and MahanKali are a win for her
  "Basically I watch only Kannada stuff"

PAIN POINTS
- Doesn’t opt for Global OTT apps since she needs local content—"Again, not a lot of local language and again same with lot of Hollywood and Bollywood"
- Doesn’t want to watch long ads
- Doesn’t want to pay as content she likes is freely available

INFLUENCES
- Actors in serials of Colors Kannada suggesting to download Voot
- Celebrities in Tent Pole properties-Bigg Boss in her case

"GIVEN A CHOICE, WILL ONLY CONSUME KANNADA"

azon Prime recently announced a content library in Kannada, as the sixth regional language to have a dedicated content library.

In summary, there is a high latent demand for regional language content already in India—if players invest well in this space, it will envelope many more consumers into the OTT space who are perhaps consuming content today on the more traditional channels or standing at the fringe.

App Combinations have a Long Tail—Need to be in the Top 3 Apps to Gain Scale
The Indian OTT market is hyper competitive and has attracted various players, from major broadcaster-backed apps to apps that only cater to specific regional content.

Over 80 percent of users use 3 apps or less, and the share of users using 4+ apps is low and drops off. App-combinations are diverse and have a long tail. The top 2-app combination only has a 13 percent share in users, while the next 2-app combination only has a 4 percent user share. Meanwhile, the top 3-app combination has only a 9 percent user share, and the next 3-app combination has only a 3 percent share (as shown in Exhibit 37). The single app consumers are currently almost fully on YouTube.

There are several implications for players:

- Breaking the clutter to create a differentiated proposition that can enable them to be among the top 3 VOD app
- Chances for potential consolidation in the long tail as apps fight to be the top 3 on consumers’ devices

This long tail of apps creates significant clutter, making it difficult to differentiate between the content offerings of the various OTT players. Consumers today are quick to move past the apps they don’t like, and delete an unused app within 7 days on average. These uninstalls are driven by the significant clutter. Awareness of available propositions continues to be a challenge, and the discovery of new OTT apps and content will be clouded due to

Q: What is your preferred language to watch each of these genres on any platform?

N = ~5000

---
this clutter. In this landscape, OTT players will need to stand out to differentiate themselves. In a space with an abundance of multi-content OTT apps, players with ‘specialized’ content, such as exclusively sports or exclusively kids content, will have an advantage and will be more likely to stand out. Breaking this clutter and emerging as a top 3 app will be the winning agenda for OTT players.

“Hero” Content Can Get Consumers on the Platform But Does Not Retain All of Them
Consumption on OTT apps spikes dramatically with Hero-content such as the Indian Premier League (IPL), Kaun Banega Crorepati (KBC), etc. as Hero programs have a very high demand among consumers. The usage of Hotstar doubled in April ’18, while usage became 5x for Airtel TV, due to the high demand and popularity of IPL. Voot saw a consumption spike with the release of the 11th season of Bigg Boss. SonyLIV first saw a surge in consumption with the start of the 2018 FIFA World Cup, and also saw a surge when the 10th season of KBC began streaming (as shown in Exhibit 38). The introduction of the play-along feature allowed a higher engagement of the audience for this show.

However, Hero-content cannot retain users on these OTT apps post conclusion of the preferred show / content unless consumers get deeply engaged in other content on the platform. The consumer survey indicated that 36 percent of users who deleted SVOD apps cited that they stopped watching as a specific show concluded as one of the key reasons, and over 40 percent mentioned finding better content as one of the key reasons. We arrive at a similar conclusion for app-wise analysis (as shown in Exhibit 39). Indicates this phenomenon among each of the top 3 SVOD apps in India (Amazon Prime, Netflix and Hotstar Premium).
**EXHIBIT 38 | Consumption Spikes with Hero Content**

Q: What are your key reasons to uninstall the app?
N= 189 SVOD lapsers
Note: Apps considered are Amazon Prime, Hotstar Premium and Netflix
The smartphone panel data analysis also indicates a drop in total installed apps post consumption of “hero”. There are a few illustrative examples only, however, they do indicate that the users who only used an app for a particular program will tend to drop-off after the program concludes. OTT players will need to ensure that content caters to specific consumer preferences, to entice these consumers into continued usage of the OTT app, even post the conclusion of the Hero-content by helping them discover similar content which is likely to keep them engaged on the platform for longer.

Marketing Challenge is High, Awareness Low for OTTs
A key barrier for OTT players is the awareness of the apps among consumers.

While the overall awareness for AVOD apps among consumers is 80 percent, the awareness for SVOD apps is only 54 percent. However, the awareness to trail / purchase is similar at 50 percent (as shown in Exhibit 40).

This indicates that SVOD penetration still requires a much higher marketing effort to build awareness and a differentiated proposition in the mind of the consumer.

The awareness of OTT apps is different for various segments of population. Females, for example, have lower than average awareness of various OTT apps, for both SVOD and AVOD (as shown in Exhibit 41 and 42). This difference in awareness indicates that marketing strategies will need to be tailored to cater to the various population segments, and this will result in a significant jump in awareness and a subsequent rise in the use of OTT apps.

The low awareness of apps among consumers poses a significant hurdle. The benefit of investing in content for relevant markets will not be realized if the content doesn’t reach the consumer. There is a significant need to increase awareness of the OTT apps and content offerings. Overcoming the awareness barrier will be key in realizing the $5 billion opportunity of the Indian OTT Market.

Music Has Traditionally Not been a Large Opportunity, However, It Does Attract Eyeballs

The music market in India is evolving. India has typically struggled with a device constraint—however, with every smartphone being used as music playing device this constraint has been lifted. While the market size in revenue terms continues to be small, there are ~100 million digital audio streaming users in India already. There are 4 apps that have really gained prominence for music in addition to YouTube which serves the purpose of watch and listen (as shown in Exhibit 43).

Accordingly, many players in the ecosystem are investing in music (as shown in Exhibit 44). In general, music apps have been seeing a growing trend among smartphone users in India. There are a few distinct characteristics of music apps emerging:

- Most music apps are “self-discovered” as found in Google survey—this highlights a much higher need for awareness. Targeted marketing by music focused players will allow these players to gain significant headway in this space (as shown in Exhibit 45)
- >50 percent of Google users surveyed indicated that they are willing to pay for music; this is really over-indexed compared to all other forms of content (as shown in Exhibit 46)

In India, like the case of video, regional content emerges as an important genre for music as well—though English and Bollywood dominate. This indicates that it is possible to create more niche offerings with music platforms (as shown in Exhibit 47).

In summary, music can be an important “layer on” opportunity for players. Digital has already taken over from all physical recorded music, album downloads, and mobile based personalization to emerge as the largest segment. However, consumer awareness is low and there is a need for innovation in marketing to really penetrate a newer set of consumers and bring into fold the “paying consumers”.

The international markets hold a significant opportunity for players in India. The innate demand for consuming Indian content on apps is already high as there is a 30 million+ Indian diaspora which is already consuming Indian content and is more attuned to OTT usage and paying for content. We conducted a survey among Google consumers (n~2000) with viewers across UAE, UK, Malaysia and the US to understand the demand for Indian content and consumer preferences. The demand for Indian content in international markets is clear as the survey indicated that over 50 percent of international watchers pay for Indian content in some form or the other, with ~15 percent paying over $20 monthly to access Indian content (as shown in Exhibit 48).

**Q:** How much money do you spend a month on average on watching Indian content?

**N:** ~100 from UAE  ~200 from UK  ~100 from Malaysia  ~300 from US
The survey revealed a few stark facts:

- **Low awareness of Indian OTT apps**
- **Consumption of Indian content is primarily through Global OTT players**
- **Contrary to popular belief, cricket is important but it is not the primary source of consumption**

### Low Awareness of Indian OTT Apps

Users are largely unaware about Indian OTT players that are available internationally. Fewer than 20 percent of respondents reported that they have heard of top Indian OTT apps (as shown in Exhibit 49). This indicates that a strong content library solely isn’t enough to tap into the international markets. There is a need to fill this awareness gap to tap into this opportunity.

### Consumption of Indian Content is Primarily through Global OTT Players

The advantage of high awareness of OTT apps is demonstrated by high share of global OTT apps, as consumption of Indian content is primarily through global OTT apps such as YouTube and Netflix (as shown in Exhibit 50). Users in international markets watch more on these OTT platforms than on TV. There is a sizeable opportunity at stake here for OTT players to tap into the international markets—leveraging on the content libraries that are being built for viewers in India.

### Cricket is Important but not the Primary Source of Consumption

Contrary to popular belief, Indian content watching in international markets is not dominated by cricket (as shown in Exhibit 51). Our survey indicates that Bollywood content (both music and movies) is the most preferred genre of Indian content watched in international markets, with 40+ percent respondents indicating Bollywood music and movies as one of their preferred genres of Indian content.

There are several reasons why consumers would prefer Indian content on apps, with the above few emerging as the top reasons. In most markets, watching Indian content on OTT apps is cheaper than watching on TV. The ability to watch on-the-go and to access latest content on demand, drives the demand.

**Respondents who watch Indian content (%)**

**Sources:** Google Consumer Survey, BCG analysis.

**Q:** Do you watch/ consume Indian content? If yes, which?

**N:** ~100 from UAE  ~200 from UK  ~100 from Malaysia  ~300 from US
for consuming Indian content on OTT (as shown in Exhibit 52).

There is potentially a sizeable international opportunity for Indian OTT players which is currently untapped. We have benchmarked OTT subscription prices to the respective countries and estimate a market size of USD 1 billion+ by 2023 (as shown in Exhibit 53), assuming average penetrations of respective Indian population in the key diaspora countries.

**Sources:** Google Consumer Survey, BCG analysis.

**Notes:**
- 2 apps per HH assumed
- HH Size: US 2.6, Saudi 5.6, Malaysia 4.6, UK 2.3, UAE 5.9 (Source: UN report)
- Subs of Indian OTT players in Int’l market as a % of total Indian diaspora population
- Current SVOD prices assumed to grow in line with respective markets
For India and Indian players to realise this opportunity, all the key stakeholders will need to play their part. There is a significant agenda ahead for the industry.

Six-Point Agenda for the Industry

Breaking the clutter: a strong marketing challenge

The consumer of today, and even more so of tomorrow, is spoilt for choice. There are over 30 OTT options available and these are mostly homogenous in the mind of the consumer. The trap is to believe that consumers will find their way on their own. In other words, there is a need to actively guide consumers to different choices, their specific propositions and the role that the platform can play in the consumer’s entertainment bouquet.

All our consumer research shows:

- Low awareness for SVOD platforms
- Significant churn across platforms—50 percent of consumers’ churn within 7 days of installing an OTT app
- Undifferentiated subscription propositions—churning consumers not convinced of “value for money”
- Consumers come to the platform for “hero” content; difficult to retain thereafter
- There are a number of app combinations installed on viewers devices with a significant long-tail
- Building broad awareness for platforms—recall but also a differentiated position to communicate, “what does the platform stand for”—to break the clutter
- Marketing to target consumers—being focused and tight about who the platform will appeal to and engaging the right tools—identify consumers’ innate and latent demand
- Driving engagement when the consumer is on the platform to enable the consumer to go beyond “hero content”—help discover the full power of the platform

For instance, creating the right level of awareness requires being present across all important ATL and BTL options—especially the digital options. For instance, Game of Thrones, an HBO show is exclusively available on Hotstar and Star network in India. However, the current search for the show online suggests limited linkage to the original source of the content (as shown in Exhibit 55).

To drive higher trials, it is imperative to create
Enhance overall awareness for individual platforms (aided and unaided recall)

Create a differentiated positioning in the market

Improve conversion from awareness to trial - establish value proposition in the mind of the target consumer

Induce trial with “hero content” and superior marketing

Create engagement on the platform beyond “hero content” during first month of the consumer using the platform and trial period

Appeal to the consumer with tight recommendations, targeted pricing and focused segment of one marketing

Sources: Consumer Research, BCG analysis.
N = ~5000
1SVOD apps considered for the analysis are Amazon Prime, Hoichoi, Hotstar Premium, Netflix, and Zee5 Premium

Online search trends showed limited linkage to the original source of the content

Got has higher number of search queries in conjunction with Netflix than with original source—Hotstar and star network

… however, association becomes high during launch period driven by marketing effort

Sources: Google trend.
a frictionless experience for the consumers and get them across the line at the “right” time. For instance, AltBalaji (similar to the Chinese OTT players) allowed for the first set of its tent pole show—Bose / Test Case to be viewed for free to pull users in and capture their interest; while to continue watching—users had to pay for access.

Similarly, it will be wise for companies to consider all potential options to ease the overall payment experience for the users. While credit cards, net banking and debit cards are commonly available across different platforms—some of the more commonly used methods such as mobile wallets, payment banks and UPI would also add more comfort to the overall payment process for the users.

To drive retention, it is important for consumers to feel that there is still enough “value” in continuing with the platform post the consumption of the hero property. Hence, it is truly important to understand the consumer and put forward the right set of next recommendations to drive users to the next right show / property to keep them hooked to the platform. Globally, Netflix has been one of the pioneers in building the content recommendation engine which has become a key competitive differentiator.

To be successful, it’s important for companies to think like a technology company first, leveraging not just the consumer data and behavior astutely—but also marrying it with great understanding of their own content and meta-tags.

Equally important is to communicate to the users on the value proposition of the platform, especially closer to the point-of-decision (which is, at the end of the monthly cycle). Only when users feel that there is “enough” on the platform to continue for one more month, does the decision to continue become intuitive.

One more aspect worth exploring would be providing intangible gains to being a paid subscriber over other users—which either allows “bragging rights” or creates a social aspect around the entire viewership experience. For instance, iQiyi for their show “The Rap of China”, a hip-pop talent show asked users to vote for their favorite rappers via Qixiu and fans to enter lucky draws held in Paopao, the online fans community of iQIYI, for tickets to the finals of the program or meet their favorite rappers at off-line gatherings.

**Differentiated Content is King**

Content differentiation in this space is key. There are several competing platforms vying for the same consumer eyeballs with so far minimal differentiation except “hero” and sports content. In this environment, platforms need to establish a distinct identity.

There are several “niches” in India where there is consumer demand but lack of credible options on content so far; these include

**Music**: requirements from music platforms in India indicate desire to “view” along with “listen”; demand for related Bollywood content such as trailers etc. is also high. Currently, this need is met primarily by YouTube, however, there could be space to build other offerings specifically addressing needs of Indian consumers in different music genres.

With the likely entry of global streaming giant Spotify in the near future, the space will possibly gather more steam in the future. Over the last year, with Jio Music and Saavn combining and launch of Amazon Music—the market has already started heating up with all the players competing for consumers.

Similar for Video SVOD, the key would be driving user stickiness on the platform which tends to be high with content availability, getting playlists created by users and driving social aspect of listening to music and sharing with users. Such user generated content, created by users, becomes one of the key factors behind user’s ability to cancel subscription at any time.

Ad-supported music platforms are also likely to continue with limited features like number of skips allowed, ability to listen to music offline, etc. to get users to try the platform.

**Kids**: our qualitative research indicates that there is a strong need for kids-specific content and platforms. There are two types of distinct
preferences: willingness to install apps that offer rich content for kids and investing in individual devices, such as tablets, for kids to watch content. There could be a unique and significant opportunity here.

- Latent demand not fulfilled as of now—Youtube currently the preferred mode of viewership
- Kids as consumers show higher engagement—higher than average watch times, international libraries used
- It is possible to tap into this opportunity using not just the content but also the platform route e.g. user interface / controls / learning interface

In case of kid’s content, there are multiple factors which come into play which will be important for players to address. Some of the aspects (non-exhaustive) to consider would include:

- Kids learning—becoming “smarter” by using latest technology / smartphone / internet and apps
- Variety and options—not just entertainment, but also associated learning
- Parental control—ability to control what / how much kids consume, to safeguard them from non-suitable content
- Perceived detrimental effects—impact on eyesight, kids being addicted to content and disregarding outdoor / physical activity

This indicates a space and need for different business models that extend beyond GEC and sports as means to get deeper into India, expand eyeballs available—and create a specific positioning to allow the platform to be one of the top 3 apps for the consumer.

- Regional content: there is a strong preference among consumers for regional language and culturally specific content as noted above in this report. This need for regional content, however, goes beyond films and GEC and extends even to niches such as news, religious / spiritual content, cookery, and comedy. While broadcaster led OTTs are starting to make forays in this space, there is also space for relevant focused regional plays in different parts of the country.

- Rural forays: as noted earlier, there is potential for rural households in India to skip the C&S step and progress directly to OTT on their smartphones. Rural smartphone penetration is already significantly higher than C&S and is growing. However, in order to build a business that is targeted at rural India, there is a need to rethink the overall business model.

- What kind of content does rural India need (storylines, characters, cultural context) etc. to truly capture their imagination and drive rural viewership
- Ad supported vs. subscription models: build an approach to monetize the rural eyeballs which is quite challenging in today’s context
- Pricing strategy: particularly to replace the “C&S” connection
- Marketing / branding / distribution: addressing the need to have a clear positioning with the rural consumer, building brand—and positioning as a credible alternative to traditional TV

Build a Geographically Focused strategy... from Rural to Regional to International

There are several imperatives emerging for OTT businesses to scale—and there are conscious choices to be made.

- International business models: the Indian diaspora presents a significant market opportunity particularly in the top 5 countries. However, the marketing challenge is quite steep with overall low recall and awareness of Indian OTT players / apps. This will require a concerted effort through digital marketing, on ground presence in top markets, leveraging social media etc. to really build the business. It is important to prioritise, pick priority markets and invest wisely.
It is also critical for players to really pick their focus geographies and languages to really make a dent and not be a “me too” player.

**Consumer Data, Consumer Insight, Big Data and Analytics**

It is a well-known fact that data is exploding. The use of this data can create true competitive differentiation for businesses that adapt well. There is a need to think of consumer data and analytics around two important business dimensions.

- Understanding consumers, deep consumer insight and segmentation
- Using analytics to drive monetization of OTT businesses

Traditionally, consumer demographic information has driven segmentation. While this captures basic consumer understanding—it misses several important motivators that really drive purchase around demand spaces (occasion’s e.g. short break at work vs. family viewing in the evening), functional and emotional needs (e.g. fandom), and attitudes (e.g. price sensitivity) etc. The exhibit below captures the difference between traditional consumer insight and segmentation vs. what is possible today with new sources of consumer insight (as shown in Exhibit 56).

There are several sources for monetizing deep consumer insight that can not only help platforms differentiate their proposition to consumers but also partners such as advertisers.

- Product design: e.g. recommendation engine, reducing the time taken to arrive at the content of choice, minimizing time between videos / shows
- Pricing: e.g. arriving at price recommendation matrix for different consumer segments, differentiated pricing
- Content acquisition: e.g. acquisition spend analytics (content green-lighting in line with expected consumer revenue
- Targeted advertising: e.g. selling specific audiences to advertisers that enables higher monetization

- Customer acquisition and prioritizing different marketing channels

Considering the vast amount of data created and tracked on OTT, it is imperative for players to use it to best understand their consumers—where they come from, what they watch and use it to best predict their likely evolution and interests going forward and service them in the most cost effective and efficient manner.

In future, it won’t be too far-fetched to assume that content viewership and user behavior on OTT platforms can be used to influence the overall content, even on the more traditional media. Considering the size of the audience, and the ability to understand the exact triggers at a much more granular level—it can really drive the overall content creation / optimization to the next level.

**Establishing a New Currency for the OTT Industry for Measurement**

There is a need for the OTT industry to establish a “currency” that can help measure and understand the impact of advertising for different types of advertisers and price in line with value created. This is essential for the long term growth of AVOD models in the country. A new currency can help represent value more holistically and capture the audience delivered (quantum, quality, segments) more sharply and holistically by

- Moving towards an industry common understanding e.g. BARC has established an industry standard understanding for TV
- Triangulate across sources
- Capture quality of audience

Most importantly, a common currency will bring a larger degree of acceptance among the overall marketing machine across the key ad buyers and allow the overall potential of the OTT watchers to be unlocked.
Invest in the Right Tech, Create a User Friendly, Economically Viable Product

Consumer demand from platforms is on the rise. Consumers are influenced by different types of online touchpoints (e.g. ecommerce, search) and define their expectations from those platforms basis those touchpoints. Platforms that are not sharp in addressing consumer expectation on quality of technology and interface will struggle to scale up.

Our consumer research also indicates that quality of touch point is one of the key criteria by which consumers decide their OTT platforms.

Hence, it is important that every platform aspiring to gain scale reviews the technology and interface implications of having their own platform. Given the tech requirement, and the fact that typically consumers will have up to 3 OTT apps on their smartphones, hence there is a likelihood of consolidation. Every independent platform will require significant investment in technology and marketing / branding to really have the ability to build critical mass. Such critical mass will allow platforms to invest in improving the overall consumer experience across the different devices of choice (mobile, tablet, smart TV and streaming media adapters enabled TVs).

CONCLUSION: The online video opportunity is for real, and it is here and now. For players, who are successful in riding this wave to gain scale in eyeballs and are able to monetize this opportunity, it will result in significant gains, adding directly to their businesses and bottom line. However, the competition for space on consumer’s smartphone is going to be an intense one and only a few shall emerge victorious.
Data Sources for Consumer Research

1. Consumer survey of ~5000 consumers from 24 cities:

Profiles of survey respondents, is shown in Exhibit 57 and 58 below

**EXHIBIT 57 | Sampling Description of Quantitative Survey**

- 32-40

*Source: Analysis conducted by Nielsen.*

3. In-depth qualitative research to form and validate hypothesis, is shown Exhibit 61 below.
4. Consumer survey among Google users

Sample: International users—700 consumers across US, UK, Malaysia and UAE

Music: ~700 consumers in India

Methodology

Google Surveys offers two panels of respondents: (1) internet users reading content on a network of web publisher sites using Google Opinion Rewards for Publishers, and (2) smartphone users who have downloaded and signed up to use an app called Google Opinion Rewards. The publisher network uses inferred demographics, while the mobile app asks users to self-report their age, gender and zip code.

We evaluate the representativeness of a survey by balancing its sample demographics to match the demographics of the target population: adult (18 or older) internet users. We match based on three demographic dimensions: age, gender, and geography. In the US, we use estimates for the national internet population from the US Census Bureau’s 2015 Current Population Survey (CPS) Computer and Internet Use Supplement. In other countries, we rely on a combination of government data and internal Google data sources.

Google Surveys uses a two-step process to ensure each survey’s representativeness. First, we use stratified sampling to dynamically target respondents with the goal of matching the demographics of the target internet population. Next, we apply post-stratification weighting to more closely match those same demographics of the target internet population.
